🌿 What is Inheritance in CSS?

Inheritance means a child element **inherits certain CSS properties from its parent element**.

🧪 Example

```
<div>
    <p>Hello World</p>
</div>
div {
    color: blue;
}
```

👉 Result:
The <p> text becomes **blue** even though no style was applied directly to it.

✓ Because `color` is an **inheritable property**

🎯 Common Inheritable Properties

These properties naturally pass down:

- `color` 🎨
- `font-size` 🔠
- `font-family`
- `text-align`
- `visibility`

👉 Basically, **text-related styles love to travel downward**

🚫 Non-Inheritable Properties

These do **NOT** inherit automatically:

- `margin` 📦
- `padding`
- `border`
- `width` / `height`
- `background`

👉 Layout-related properties stay put like stubborn furniture 🪑

⚡ Forcing Inheritance

You can force a property to inherit using:

```
p {
    color: inherit;
}
```

👉 Now <p> will take color from its parent no matter what.

❌ Preventing Inheritance

```
p {
    color: initial;
}
```

- `initial` → resets to default browser value

🧠 Special Values

1. `inherit`

Takes value from parent

```
color: inherit;
```

2. `initial`

Default value

3. `unset`

Smart reset:

- Inheritable → acts like `inherit`
- Non-inheritable → acts like `initial`

🧩 Example Combo

```
body {
    color: black;
}

div {
    color: blue;
}

p {
    color: inherit;
}
```

👉 <p> inside `<div>` → **blue**

👉 <p> outside → **black**
