💧 flex-shrink kya hota hai

👉 **Jab space kam pad jaata hai, kaun kitna chhota hoga**

- Agar container chhota hai aur items fit nahi ho rahe
- to items **shrink (chhote)** honge
- aur **flex-shrink decide karega kitna shrink**

🧠 Ek line yaad rakh

👉 **flex-shrink = "kitna sacrifice karega apni size ka"**

🎯 Example 1 (default behavior)

```
.item {
  flex-shrink: 1;
}
```

- Sabka shrink = 1
  👉 sab **equal chhote honge**

🎯 Example 2 (real understanding 🚀)

```
.item1 { flex-shrink: 1; }
.item2 { flex-shrink: 2; }
.item3 { flex-shrink: 1; }
```

👉 Space kam hai

- item2 → **double shrink karega**
- baaki → normal shrink

✔️ same concept like grow but **reverse direction**

⚡ Super important

👉 Default hota hai:

```
flex-shrink: 1;
```

👉 Matlab:
“haan bhai, zarurat pade to main chhota ho jaunga” 😄

🚫 Killer trick (interview + real use)

```
flex-shrink: 0;
```

👉 Matlab:
“main nahi sikudunga 😤”

- item apni size maintain karega
- overflow bhi ho sakta hai
